About Whisk Studio

Whisk Studio offers you a centralized platform to build and manage recipe content that's well structured, visual, consistent, and shoppable. It has tools to create, enhance, personalize and distribute recipe content, and connect it to grocery carts. It allows creators, businesses, and publishers to create a unified recipe database. Every recipe is inspected and analyzed, allowing you to get nutrition data, truly shoppable ingredients and so much more. With Whisk Studio you can have all your recipes in one place and choose, where and how you want to publish them. For more information, please download the brochure or reach out to your Account Manager.

Using Whisk Studio:

- You can ***manage your recipe content*** by importing data from your existing database or creating new recipe content using our predefined template. It also lets you search your database quickly and easily.
- You can ***optimize your recipe content*** by structuring and tagging your recipes with labels such as meal type, cooking technique, cuisine, diet restrictions, and allergy restrictions. Whisk does it automatically for you and also lets you create your own custom labels. Additionally, It also provides you with automatic recipe nutrition calculation and health score using reliable FDA data and an option to edit for maximum flexibility.
- You can ***build an inspiring content experience*** for your customers by accessing your content through our apps, plugins, or API and publishing it on any experience.
- You can pull all your branded and private label products into the platform or create new products using our predefined template, and **use branded products** as ingredients in your recipes.

Release Strategy

As we continue to provide you the best experience managing your recipe content, we are currently focusing on features and enhancements prioritized within the roadmap. Our product management team bundles tasks into releases with a clear vision of how each release will impact your use of our product.

Release Details

| Release Version	1.4
Release Date	February 9th, 2020.

Available now, Whisk Studio `v1.4` focuses on providing you an improved user experience.

What's New in this Release?

Here are new features and functionalities introduced in this release:

New Integrations Setup Page

You can now see all the supported integration types for content synchronization on a newly introduced **Integrations** page in Whisk Studio. This new page allows you to choose and set up the Integration as per need.
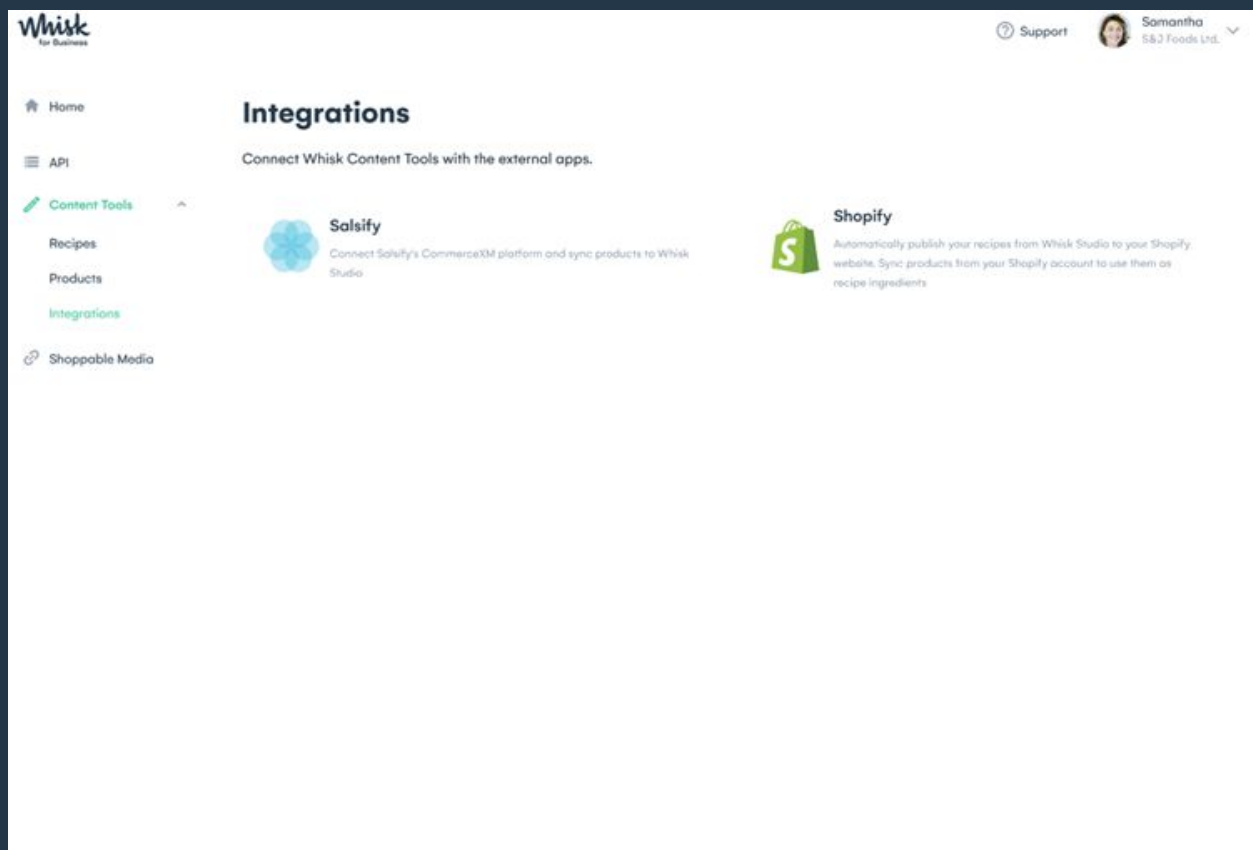

Salsify Integration

We have introduced an ability to integrate Whisk Studio with Salsify to synchronize your products' data and use them as ingredients in your recipes. You can find this new integration type on the **Integrations** page in Whisk Studio. To learn more about it, see Salsify Integration.

Improved UI of the Whisk Studio app on Shopify

We have made many UI improvements in the Whisk Studio app on Shopify to make your experience satisfying.

Option to unpublish a recipe

You can now unpublish any recipe and retain it as a draft rather than deleting it from Whisk Studio. This option is now available as a button that you can find on individual recipe pages.
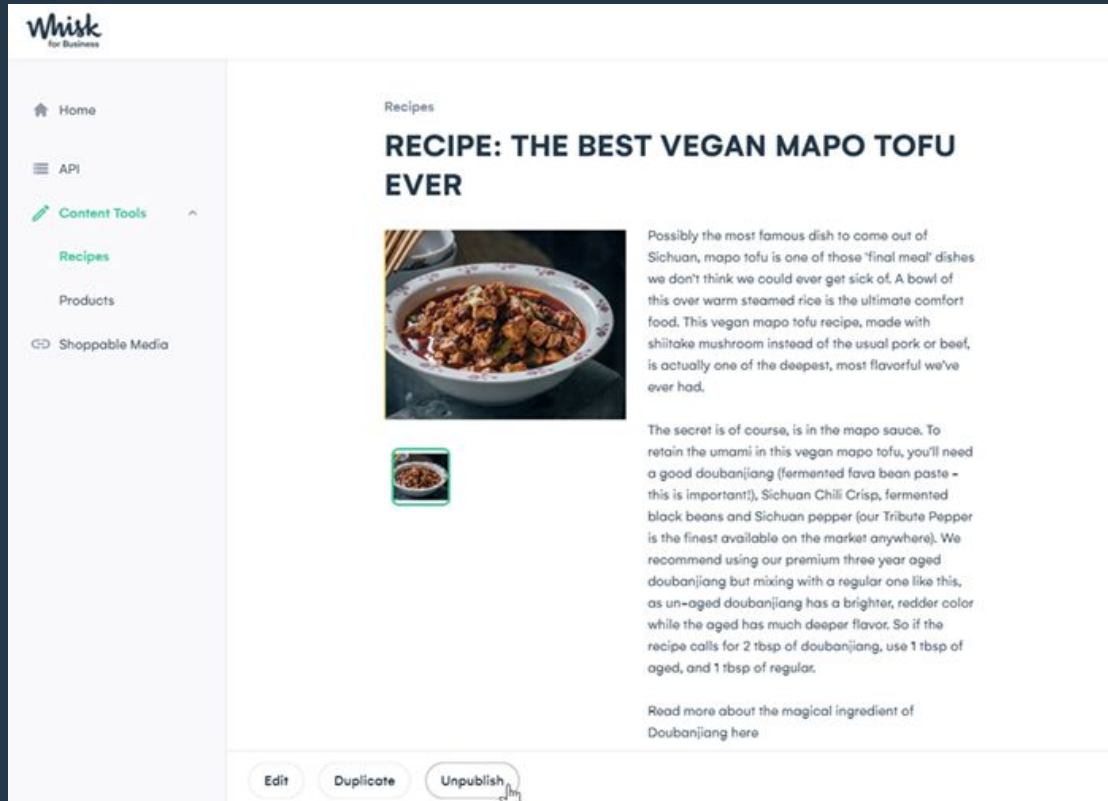

Ability to add supplementary text in recipe's branded product ingredients

You can now append any additional text while adding branded products as ingredients in a recipe. For example, when adding "Philadelphia Cream Cheese" as an ingredient to a recipe, you can add the text "Soften" to make it more descriptive.

Read-only products

You can now have read-only products on Whisk Studio to avoid your synchronized products from being edited. This way, you can only edit the products on the native app or platform and enable

only one-way synchronization.

Avoidances and Diets support for Recipes

We have introduced an ability to automatically set avoidances and diet-related labels in your recipes that can also override if needed. This way, your readers who have specific dietary

constraints would be able to find your recipes easily.

Fixed Issues

Here is the list of bug fixes done in this release:

Issue ID	Description
WBS-1621	Recipes sync automation between ES / Postgres.
WBS-1655	The original image URL is missing in the linked_product object.
WBS-1710	Product API allows creating two products with the same external_id without any errors.
WBS-1662	Without clicking the Save button, a product gets saved in Whisk Studio immediately on clicking Duplicate.
WBS-1717	Unable to save or display Total Carbohydrates for a product.
WBS-1719	Unable to save the product in the Korean language.
WBS-1676	The Edit button is visible for read-only products.
WBS-1718	The Cholesterol value is not displayed after duplicating the product.
